

## Assignment #6

### Practice with JUnit

CS 4354 Summer II 2014

Instructor: Jill Seaman

**Due:** before class **Monday, 8/4/2014** (upload electronic copy by 9:30am).

---

Write some tests using JUnit for the Library Management System described in Assignment 4. A preliminary (incomplete) version of the Library Management System is available on TRACS. Download and install the Library Management System into an eclipse project (or use another IDE, or the command line).

Include test cases for the following:

1. Test the **method Resource.calculateFine(Calendar)**. You should have at least 4 test cases, including the “exceptional cases”. `java.util.Calendar` is described below.
2. Test the **Collection class** (this is the list of Resources owned by the Library). For this assignment you may test just the `addResource(Resource)` method. You should include a successful and an unsuccessful add operation. Note that you are indirectly testing the private `searchList()` method as well.
3. Test the **collaborating classes** Member and Resource as they carry out the **Resource.calculateNewDueDate()** operation. You should have 4 tests for this, one for each combination of a Member subclass and a Resource subclass.
4. (optional) Test the **CheckoutControl.checkout** operation. Be sure to test a successful checkout operation. Note: you will need to verify more than just the value of the Calendar date returned. You should also verify that the Member and Resources were changed appropriately.

#### **java.util.Calendar:**

The Library Management System uses this type to record the due date of the items, and the due date is calculated from a given start date. It also uses this type to calculate the value of the fines on overdue resources. You are encouraged to look it up in the online Java API, but this should be enough information to do the testing you need to do:

```
Calendar date = Calendar.getInstance(); // constructs a value equal to the current date
date.add(Calendar.DATE, 10);
// Adds (or subtracts) the specified amount of time to the given calendar field. It changes
// the value of the object it is called on. This example advances date to 10 days ahead.
```

**NOTES:**

- This assignment is to be done with your partner (in groups of 2).
- Use the package "assign6" for your classes and put your files in the appropriate directory structure. Submit ONLY your test case java files!!
- Follow the style guidelines from the class website. Javadoc comments are not required, but good comments describing each test method are required.

**Submit:**

Please combine your \*.java files into a single zip file (assign6\_XXXXXX\_YYYYYY.zip). The XXXXXX and YYYYYY are your TX State NetIDs (mine is js236, you have two, one for each partner). Submit an **electronic copy**, using the Assignments tool on the TRACS website for this class.
