Week 2	2: Console	e I/O and Operators	2.14 Arithmetic Operators	
	(2.14,3.1- CS Fal	Chapter 3 -6,3.9-10,5.1) 5 1428 I 2014 Seaman	 An <u>operator</u> is a symbol that tells the computer to perform specific mathematical or logical manipulations An <u>operand</u> is a value used in an operation. C++ has unary, binary, and ternary operators: unary (1 operand) -5 binary (2 operands) 13 - 7 ternary (3 operands) exp1 ? exp2 : exp3 	
Arithmetic Operators			Integer Division	
Unary operators:			 If both operands are integers, / (division) operator always performs <u>integer division</u>. 	
SYMBOL	L OPERATION unary plus	EXAMPLES	The fractional part is lost!!	
+	negation	-5, -x	cout << 13 / 5; // displays 2	
+		-5, -x	cout << 13 / 5; // displays 2 cout << 91 / 7; // displays 13	
+	perators:	-5, -x	cout << 91 / 7; // displays 13	
+ - • Binary o	perators:			
+ - • Binary о sүмвог	operators:	EXAMPLE	 cout << 91 / 7; // displays 13 If either operand is floating point, the result is 	
+ - • Binary о <u></u> \$үмвоц +	operators:	EXAMPLE x + y	 cout << 91 / 7; // displays 13 If either operand is floating point, the result is floating point. cout << 13 / 5.0; // displays 2.6 	
+ - • Binary о <u>sүмво</u> + -	operators: OPERATION addition subtraction	EXAMPLE x + y index - 1	 cout << 91 / 7; // displays 13 If either operand is floating point, the result is floating point. 	

3.1 The cin Object Modulus • % (modulus) operator computes the cin: short for "console input" remainder resulting from integer division • a stream object: represents the contents of the screen that are entered (typed) by the user using the keyboard. // displays 3 cout << 13 % 5; requires iostream library to be included // displays 0 cout << 91 % 7; • >>: the stream extraction operator • use it to read data from cin (entered via the keyboard) • % requires integers for both operands cin >> height; when this instruction is executed, it waits for the user to type. cout << 13 % 5.0; // error it reads the characters until space or enter (newline) is typed, // error cout << 91.0 % 7; then it stores the value in the variable. right-hand operand MUST be a variable. 5 **Console Input** Example program using cin #include <iostream> • Output a prompt (using cout) to tell the user using namespace std; what type of data to enter BEFORE using cin: int main() { int length, width, area; int diameter; cout << "This program calculates the area of a "; cout << "rectangle.\n";</pre> cout << "What is the diameter of the circle? ";</pre> cin >> diameter; cout << "Enter the length and width of the rectangle ";</pre> cout << "separated by a space.\n"; • You can input multiple values in one statement: cin >> length >> width; area = length * width; cout << "The area of the rectangle is " << area << endl;</pre> int x, y; return 0; cout << "Enter two integers: " << endl;</pre> cin >> x >> y;This program calculates the area of a rectangle. Enter the length and width of the rectangle the user may enter them on one line (separated by a space) output screen: separated by a space. or on separate lines. 10 20 The area of the rectangle is 200

 3.2 Mathematical Expressions 4 marking a program component that evaluates to a value. 5 an expression can be a iteral, a variable, or a combination of these using operators and parentheses. 5 marking a structure of the set using operators and parentheses. 5 marking a structure of the set using operators and parentheses. 5 marking a structure of the set using operators and parentheses. 6 marking a structure of the set using operators and parentheses. 6 marking a structure of the set using operators and parentheses. 6 marking a structure of the set using operators and parentheses. 7 marking a structure of the set using operators and structure of the set using the s	<section-header><section-header><text><text><text><text></text></text></text></text></section-header></section-header>
<pre>Operator Precedence (order of operations) • Which operation gets done first?</pre>	Parentheses• You can use parentheses to override the precedence or associativity rules:

Exponents	3.3 Type Conversion	
 There is no operator for exponentiation in C++ There IS a library function called "pow" y = pow(x, 3.0); // x to the third power The expression pow(x, 3.0) is a call to the pow function with arguments x and 3.0. Arguments can have type double and the result is a double. If x is 2.0, then 8.0 will be stored in y. The value stored in x is not changed. #include <cmath> is required to use pow.</cmath> 	 The computer (ALU) cannot perform operations between operands of different types. If the operands of an expression have different types, the compiler will convert one to be the type of the other This is called an <u>implicit type conversion</u>, or a type coercion. Usually, the operand with the lower ranking type is converted to the type of the higher one. 	
Type Conversion Rules• Binary ops: convert the operand with the lower ranking type to the type of the other operand.int years; float interestRate, result; result = years * interestRate; // years is converted to float before being multiplied• Assignment ops: rhs is converted to the type of the variable on the lhs.OUTPUT: 10int x, y = 4; float z = 2.7; x = 4 * z; //4 is converted to float, //then 10.8 is converted to int (10) cout << x << endl;	<pre>Substrain Strain S</pre>	

3.4 Overflow/Underflow 3.6 Multiple Assignment You can assign the same value to several When the value assigned to a variable is too variables in one statement: large or small for its type. • integers tend to wrap around, without warning: a = b = c = 12;short testVar = 32767; cout << testVar << endl;</pre> // 32767, max value testVar = testVar + 1; is equivalent to: cout << testVar << endl;</pre> //-32768, min value floating point value overflow/underflow: a = 12: b = 12: may or may not get a warning c = 12;result may be 0 or random value 17 18 5.1 Increment and Decrement 3.6 Combined Assignment • Assignment statements often have this form: C++ provides unary operators to increment and decrement. number = number + 1; //add 1 to number total = total + x;//add x to total Increment operator: ++ y = y / 2;//divide y by 2 Decrement operator: -- can be used before (prefix) or after (postfix) a int number = 10;number = number + 1; variable cout << number << endl;</pre> Examples: • C/C++ offers shorthand for these: int num = 10;// short for number = number+1; //equivalent to: num = num + 1; number += 1; num++; total -= x; // short for total = total-x: // equivalent to: num = num - 1; num--;

++num; --num; //equivalent to: num = num + 1;

// equivalent to: num = num - 1;

20

y /= 2; // short for y = y / 2;

19

Prefix vs Postfix

- ++ and -- operators can be used in expressions
- In prefix mode (++val, --val) the operator increments or decrements, then returns the value of the variable
- In postfix mode (val++, val--) the operator returns the value of the variable, then increments or decrements

```
int num, val = 12;
cout << val++; // cout << val; val = val+1;
cout << ++val; // val = val + 1; cout << val;
num = --val; // val = val - 1; num = val;
num = val--; // num = val; val = val -1;
```

It's confusing, don't do this!

```
21
```

3.9 More Math Library Functions

- These require ${\tt cmath}$ header file
- These take double as input, return a double
- Commonly used functions:

pow	y = pow(x,d);	returns x raised to the power d
abs	y = abs(x);	returns absolute value of x
sqrt	<pre>y = sqrt(x);</pre>	returns square root of x
sin	y = sin(x);	returns the sine of x (in radians)
etc.		

22

3.10 Hand Tracing a Program

- You be the computer. Track the values of the variables as the program executes.
 - step through and 'execute' each statement, one-by-one
 - record the contents of variables after each statement execution, using a hand trace chart (table)

<pre>int main() {</pre>
double num1, num2, num3, avg;
<pre>cout << "Enter first number";</pre>
cin >> num1;
<pre>cout << "Enter second number";</pre>
cin >> num2;
<pre>cout << "Enter third number";</pre>
cin >> num3;
avg = num1 + num2 + num3 / 3;
cout << "The average is " << avg
<< endl;

num1	num2	num3	avg
?	?	?	?
?	?	?	?
10	?	?	?
10	?	?	?
10	20	?	?
10	20	?	?
10	20	30	?
10	20	30	40
10	20	30	40
